

Interoperability in The European Library

'the devil is in the details'

Sjoerd Siebinga

The European Library

➔ A *hybrid* portal

- Different libraries demand different communication protocols to access their collections
- Overlapping techniques/protocols are used to connect from the portal to the different libraries and return results from the users queries to the browser

http
@

the techniques / protocols used

<http://www.domain.com?operation=searchRetrieve&query=einstein>

 **SRU** (Search Retrieve via **U**rl)

- Default search/retrieve protocol
- SRU enabled libraries are queried directly using this protocol

the techniques / protocols used

➔ Z39.50

- Libraries with Z39.50 systems are queried through a Z39.50/SRU gateway:
 - Central gateway (housed on our server)
 - Local gateway (housed on remote server)
- Translates SRU requests to Z39.50 session
- Character-set conversions
- Provide on-the-fly addition of information to Z39.50 record (e.g. base URL for linking to records)

the techniques / protocols used

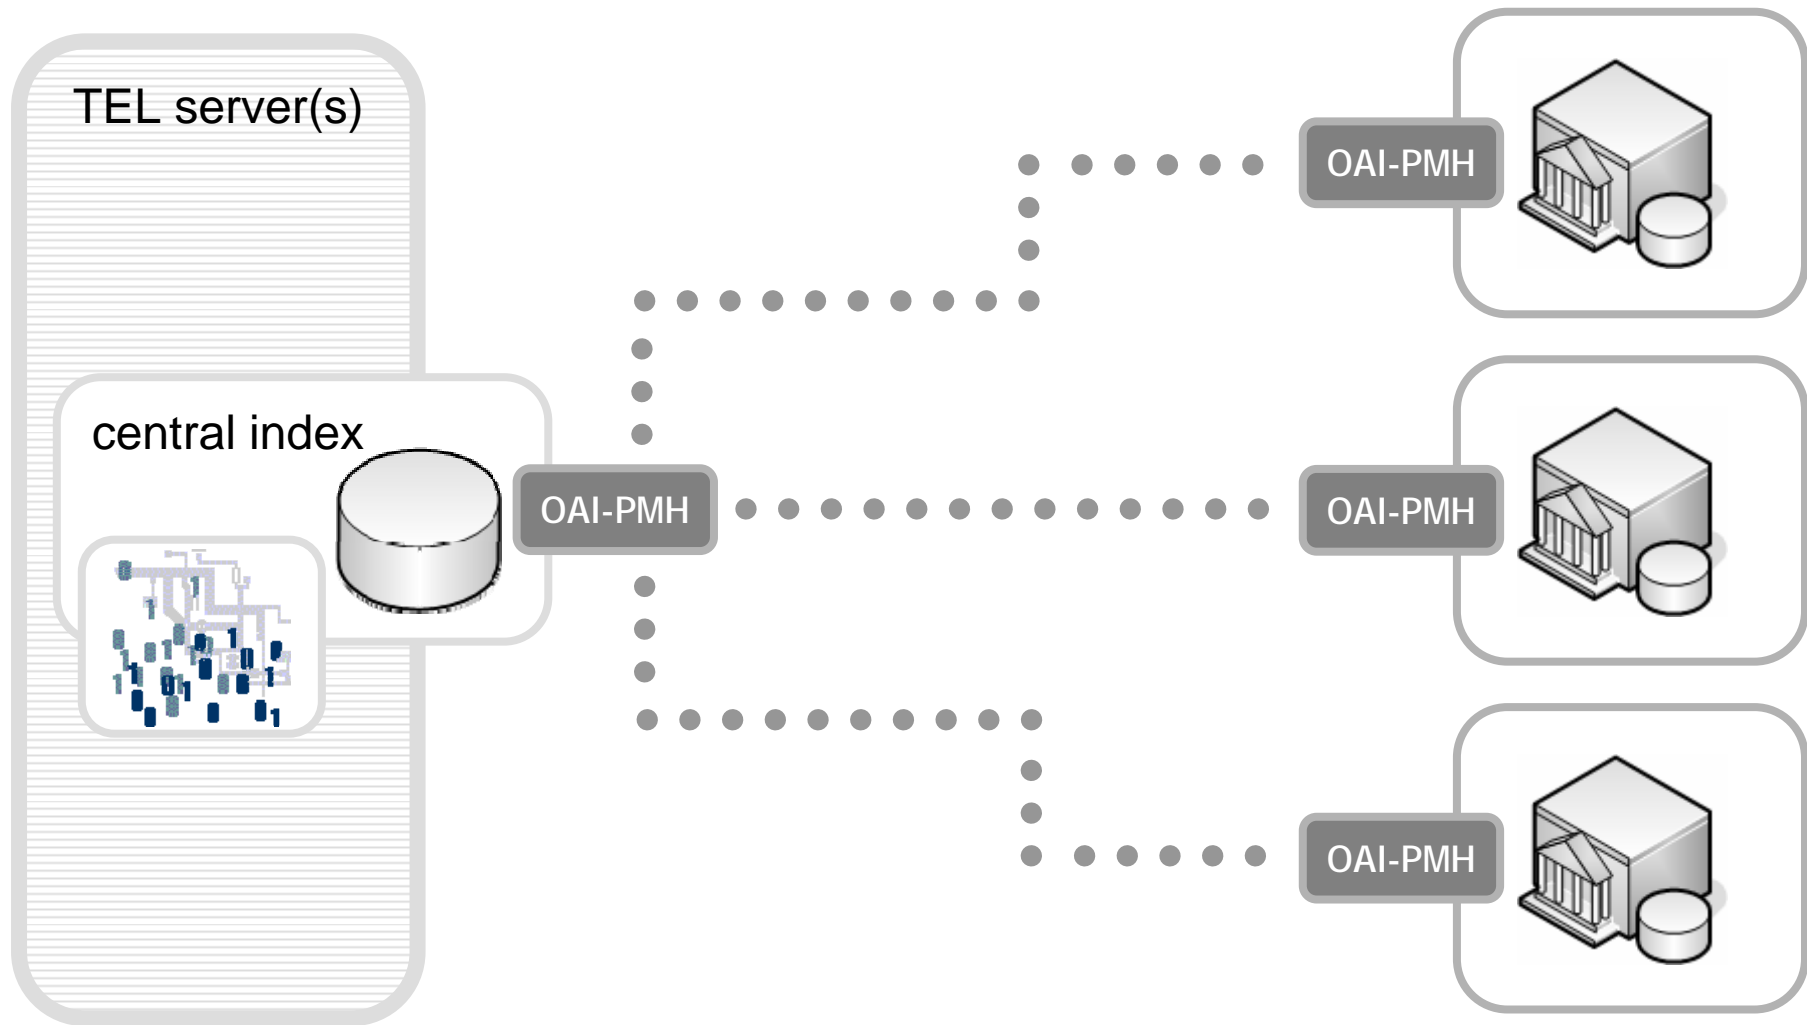

➔ **AJAX** (Asynchronous Javascript And Xml)

– Allows for browser page to be updated with returned data from a query without reloading the page

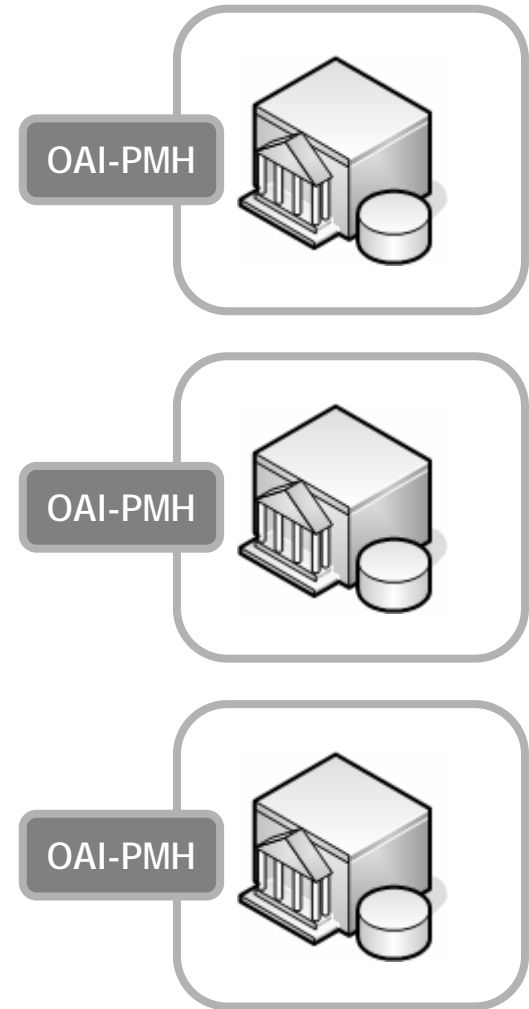

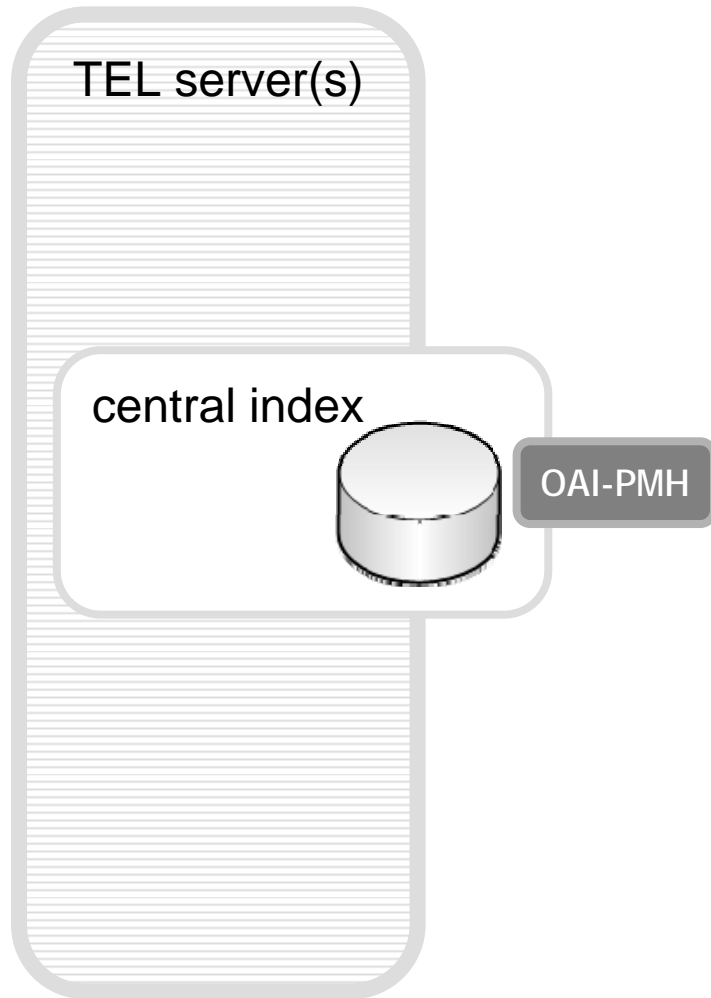

– All searches are executed from within the browser and directed towards multiple targets using this technique

Harvesting via OAI-PMH

Harvesting via OAI-PMH

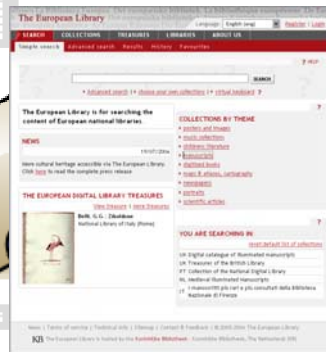

Loading the portal

TEL server(s)

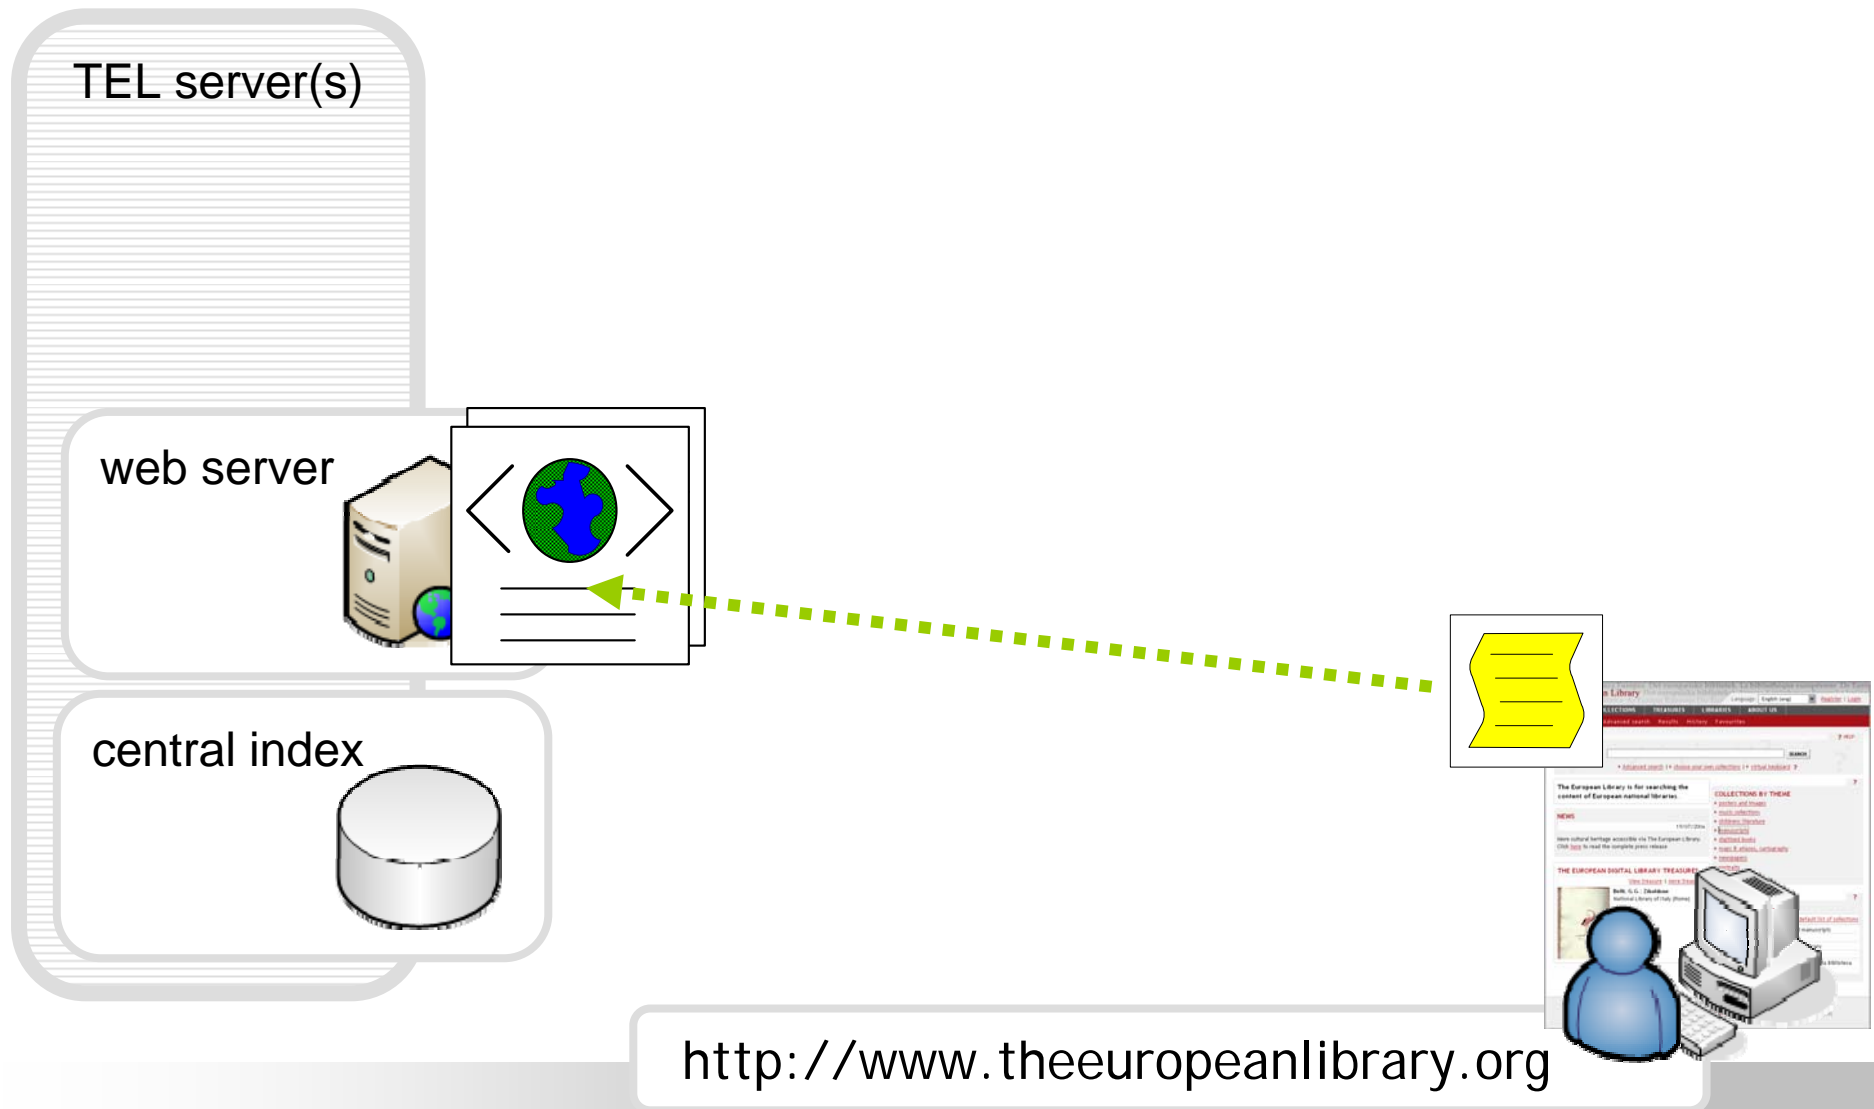

web server

central index

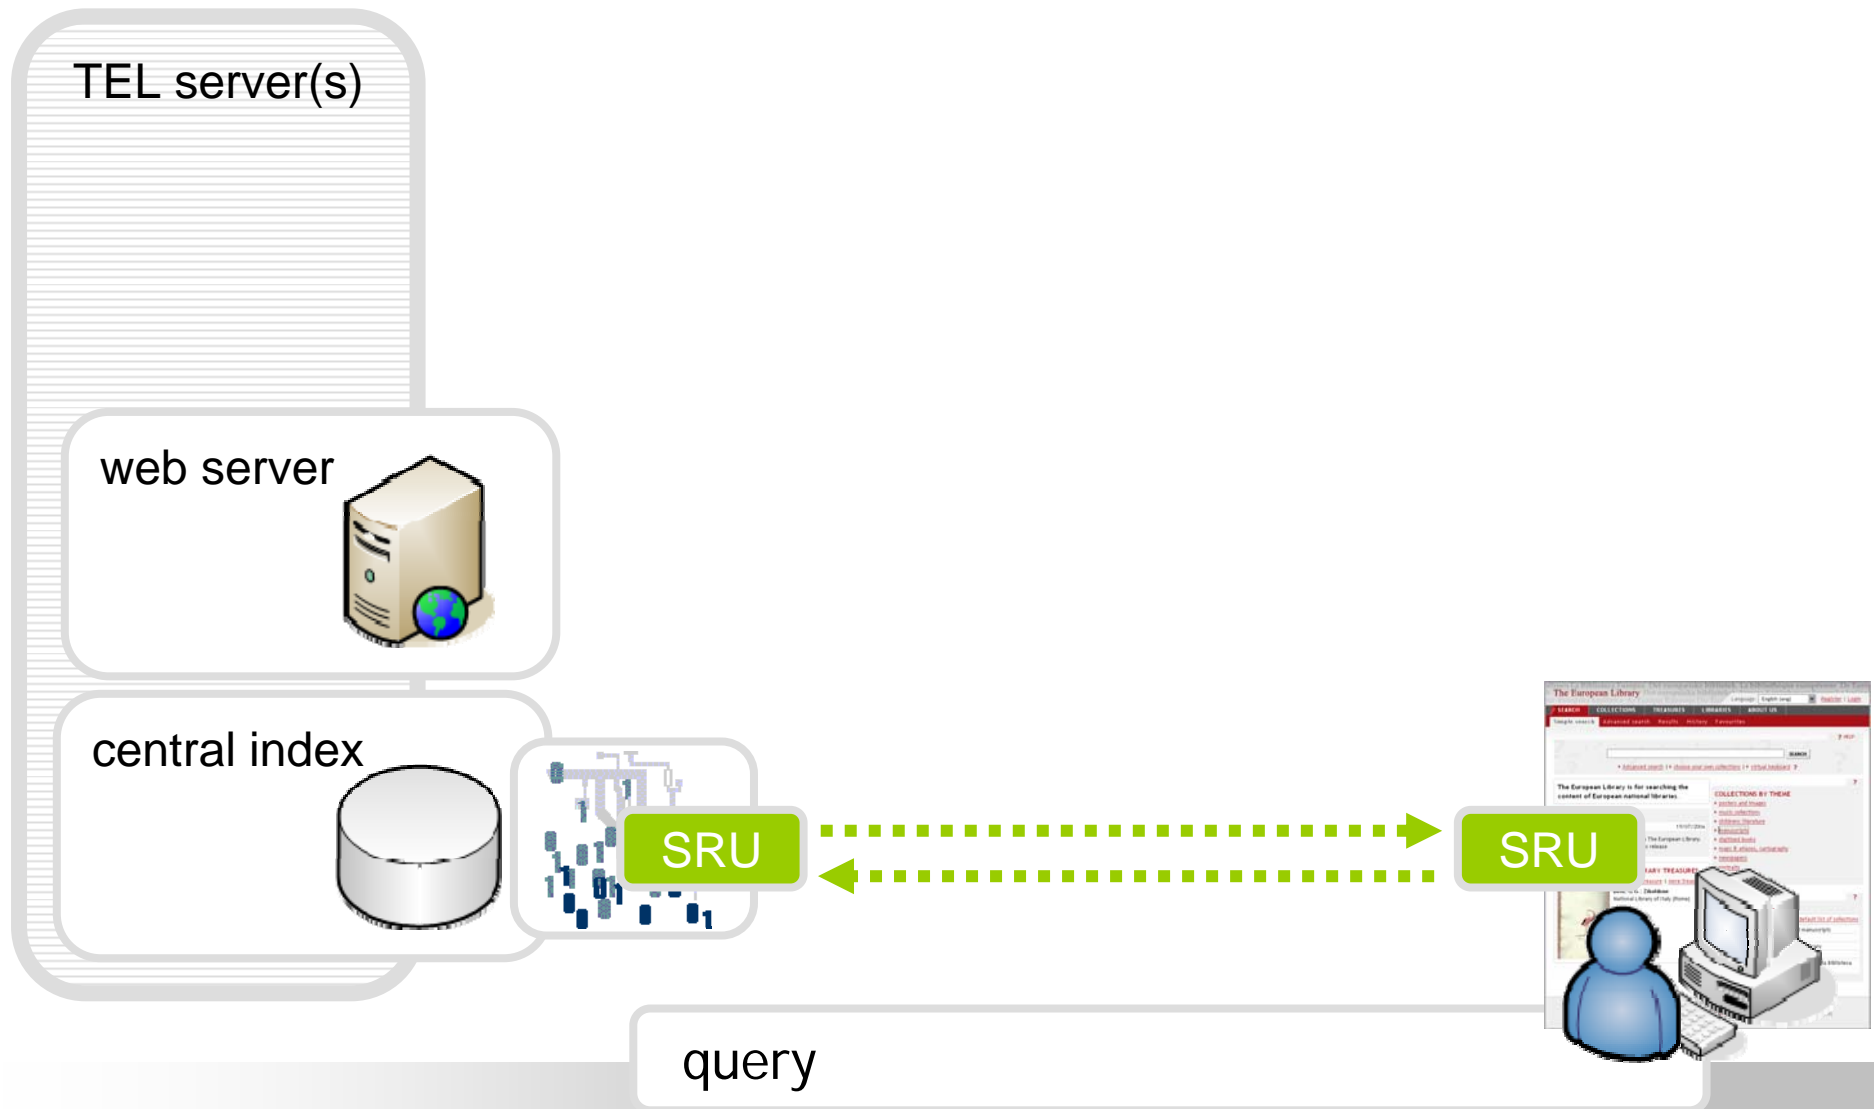

<http://www.theeuropeanlibrary.org>

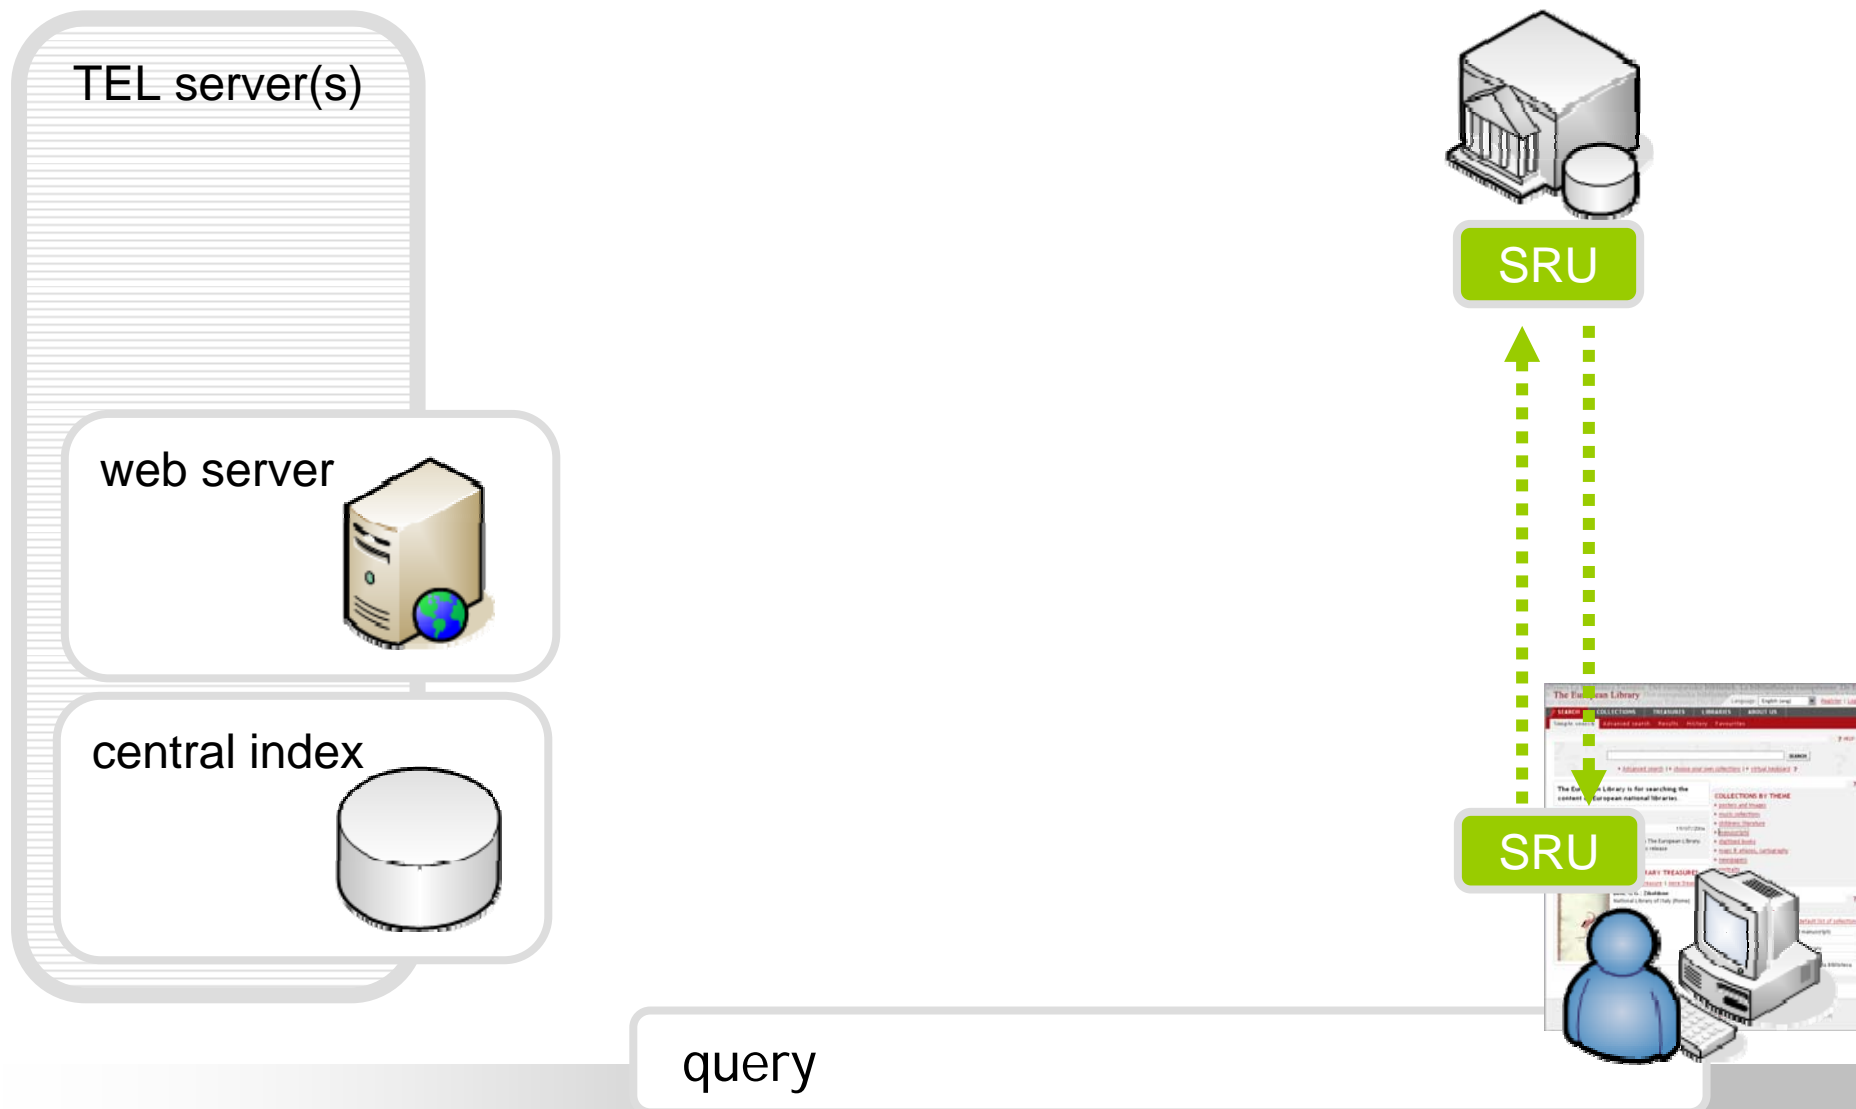

Loading translations and collections

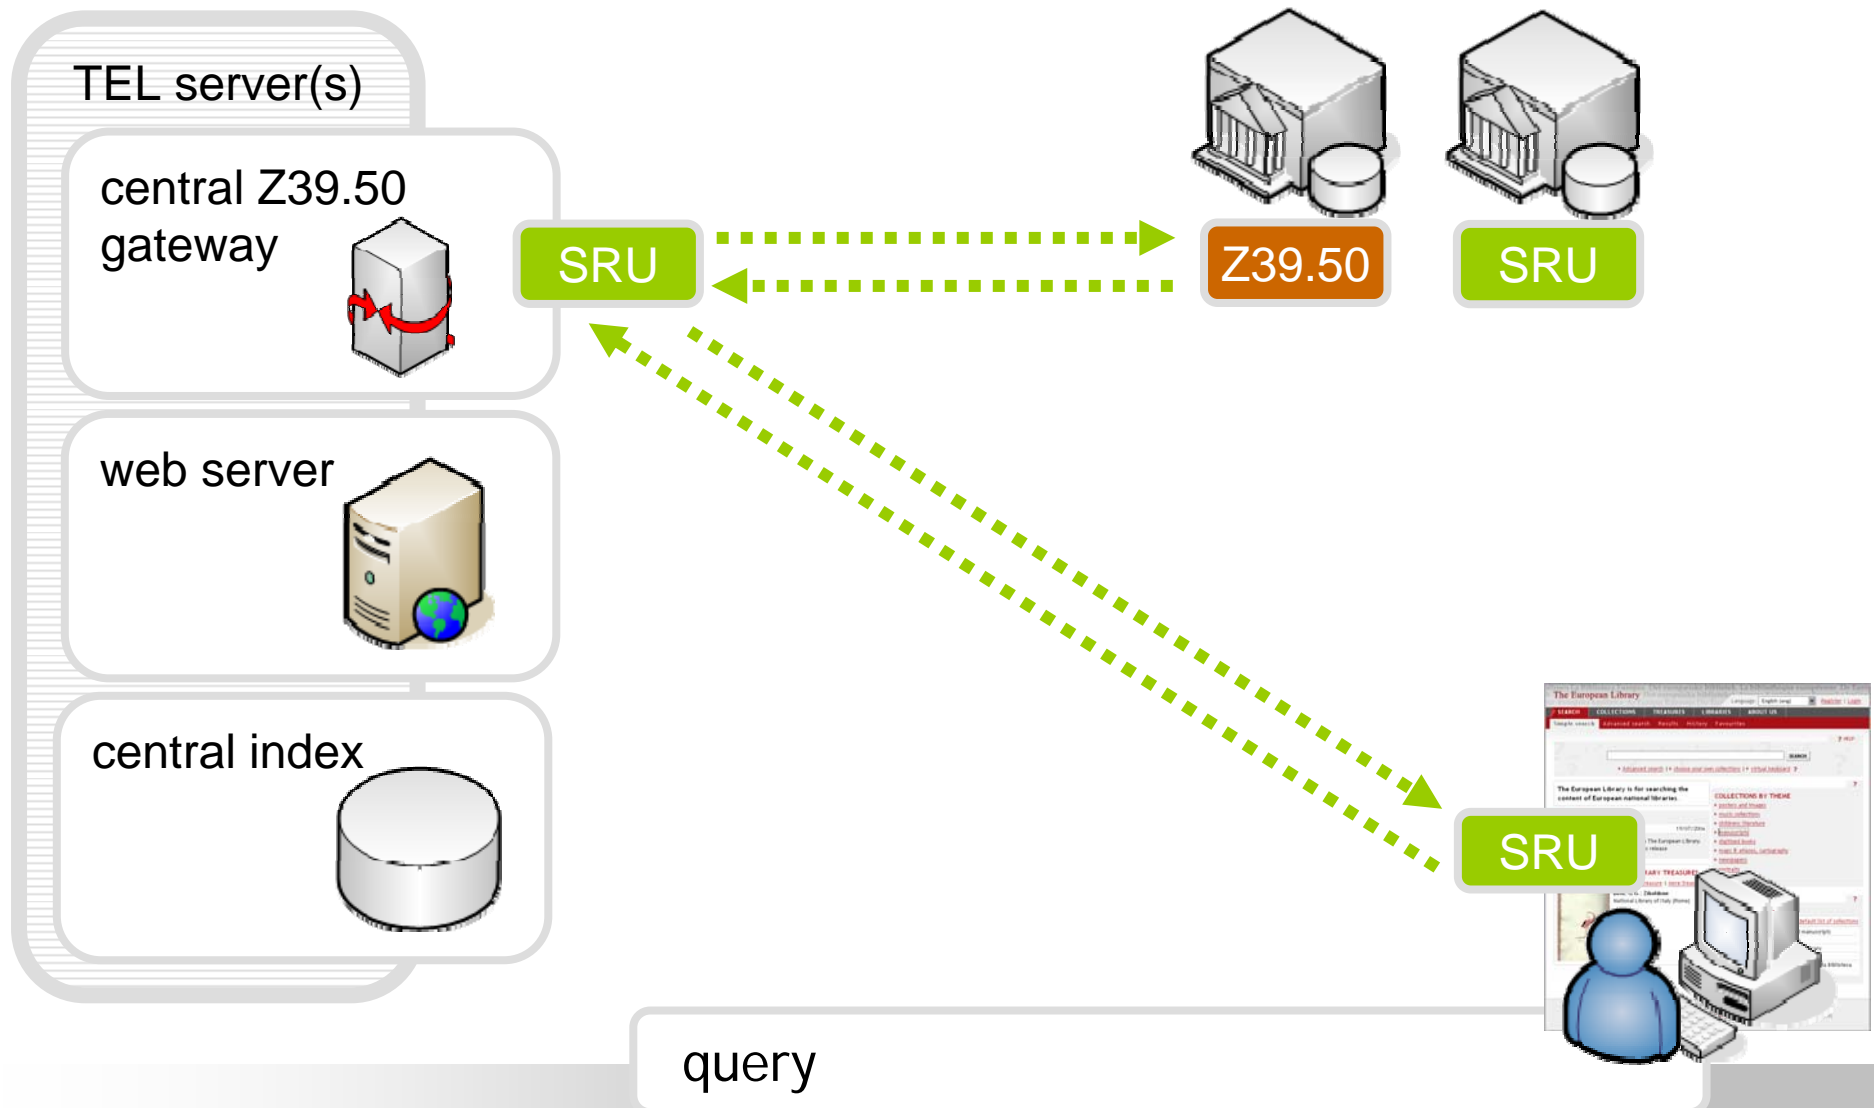

Search/retrieve - central index

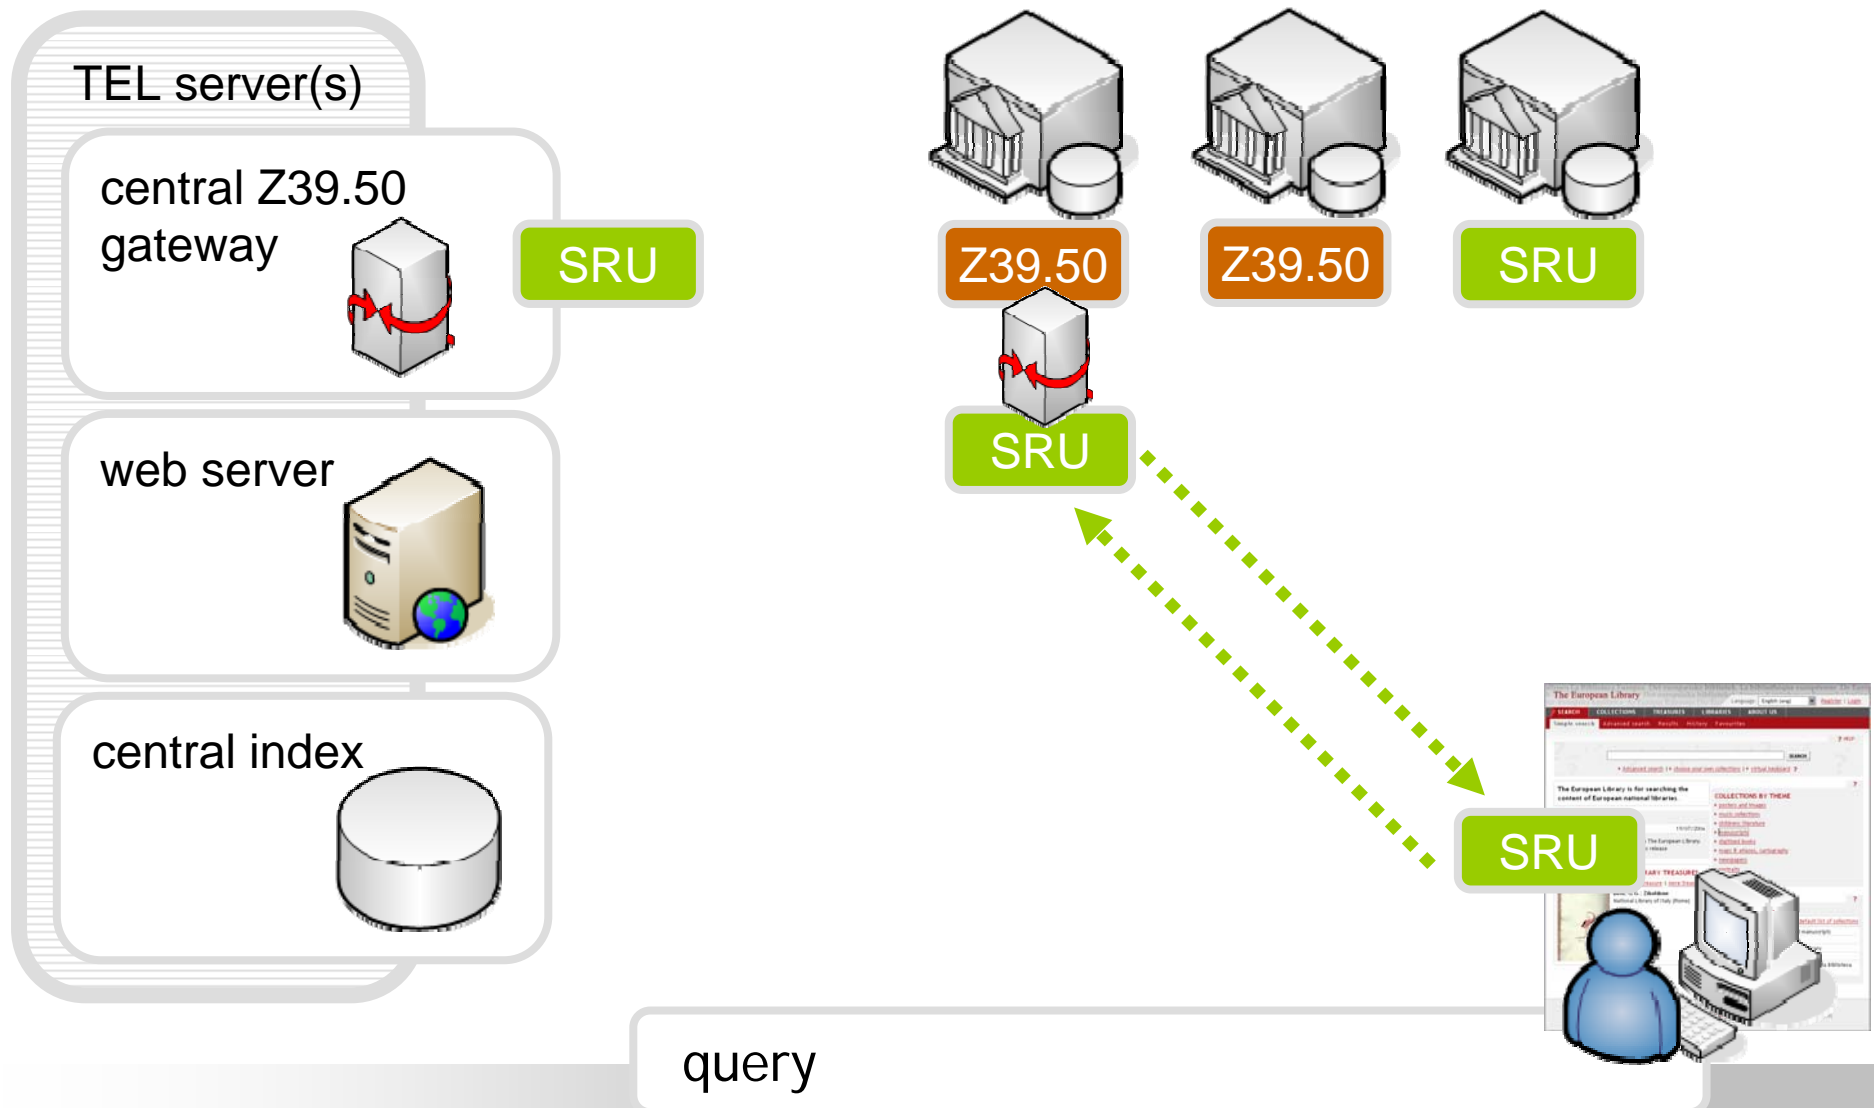

Search/retrieve - SRU enabled library

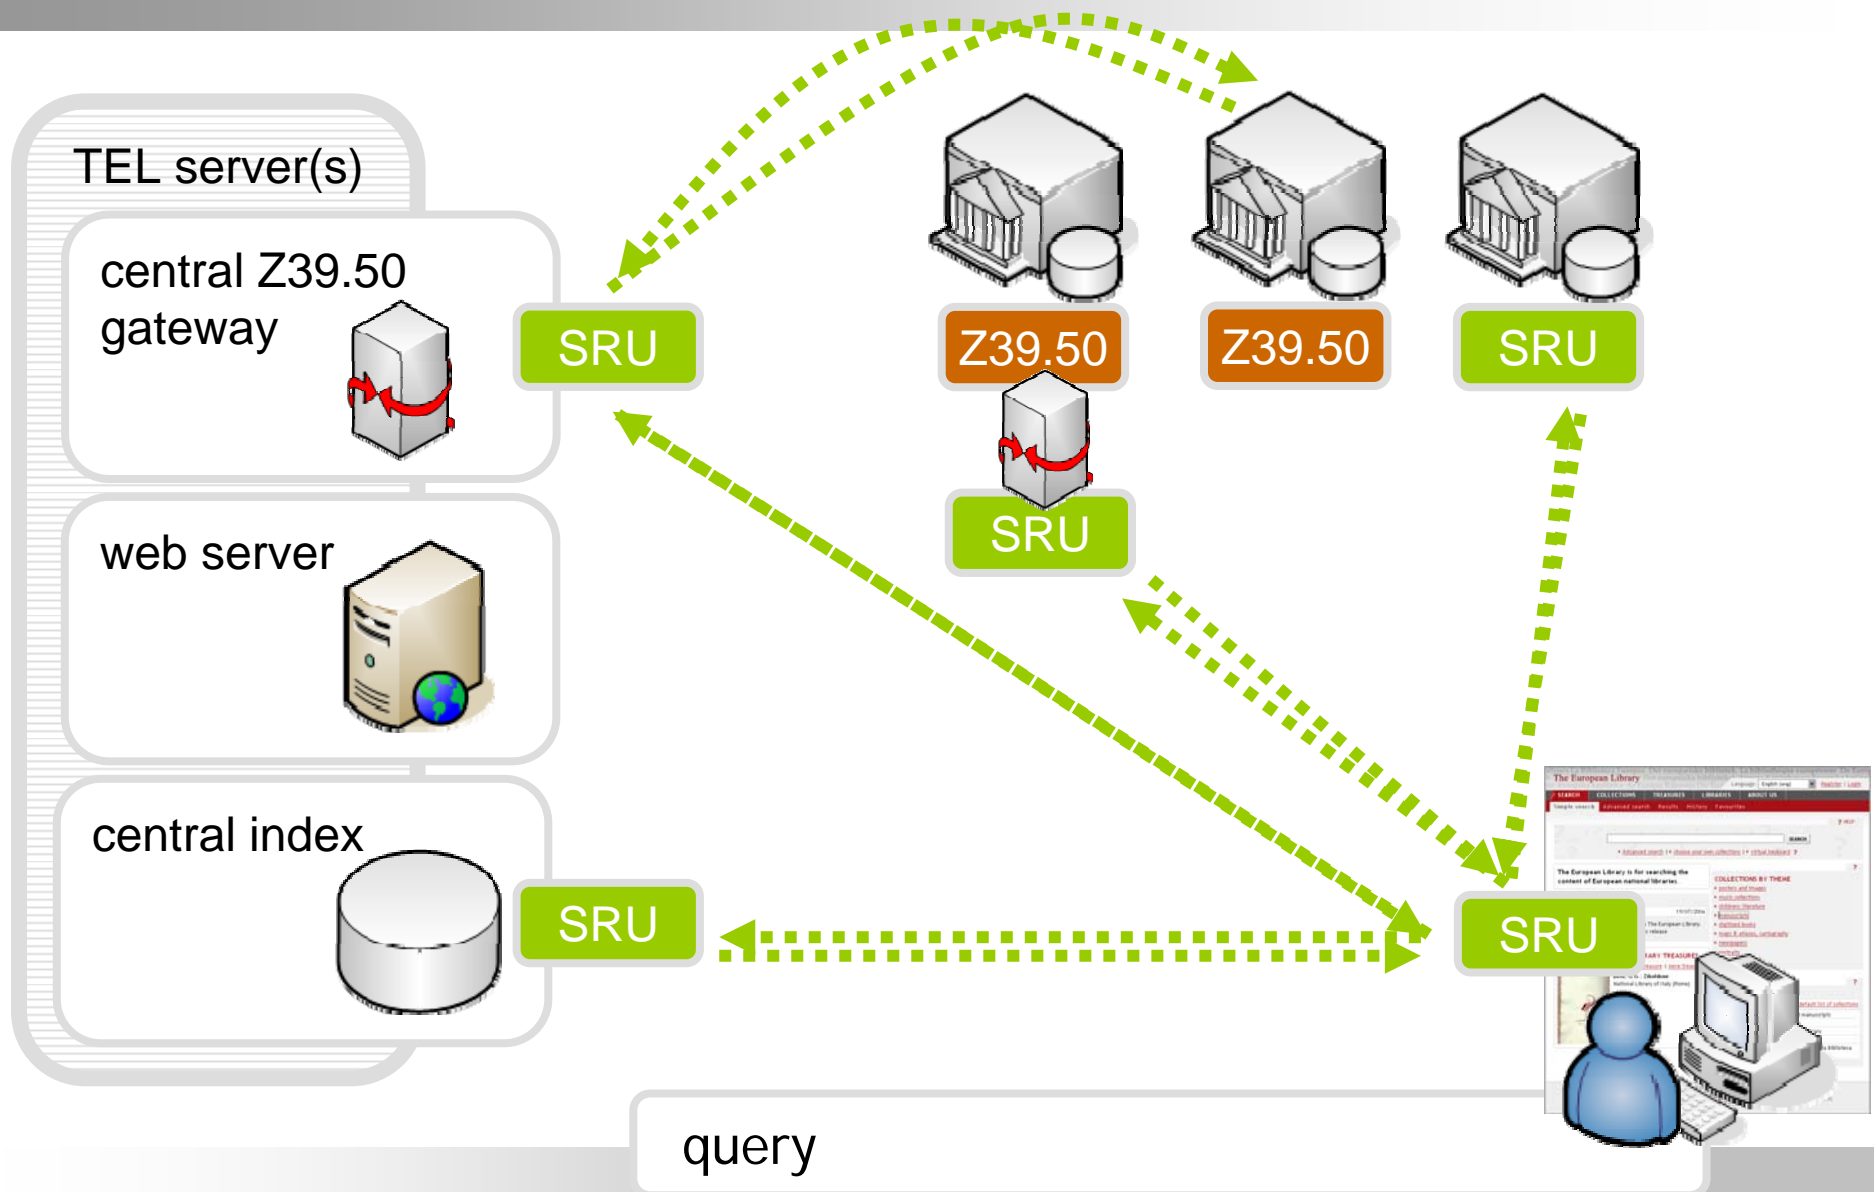

Search/retrieve - central gateway

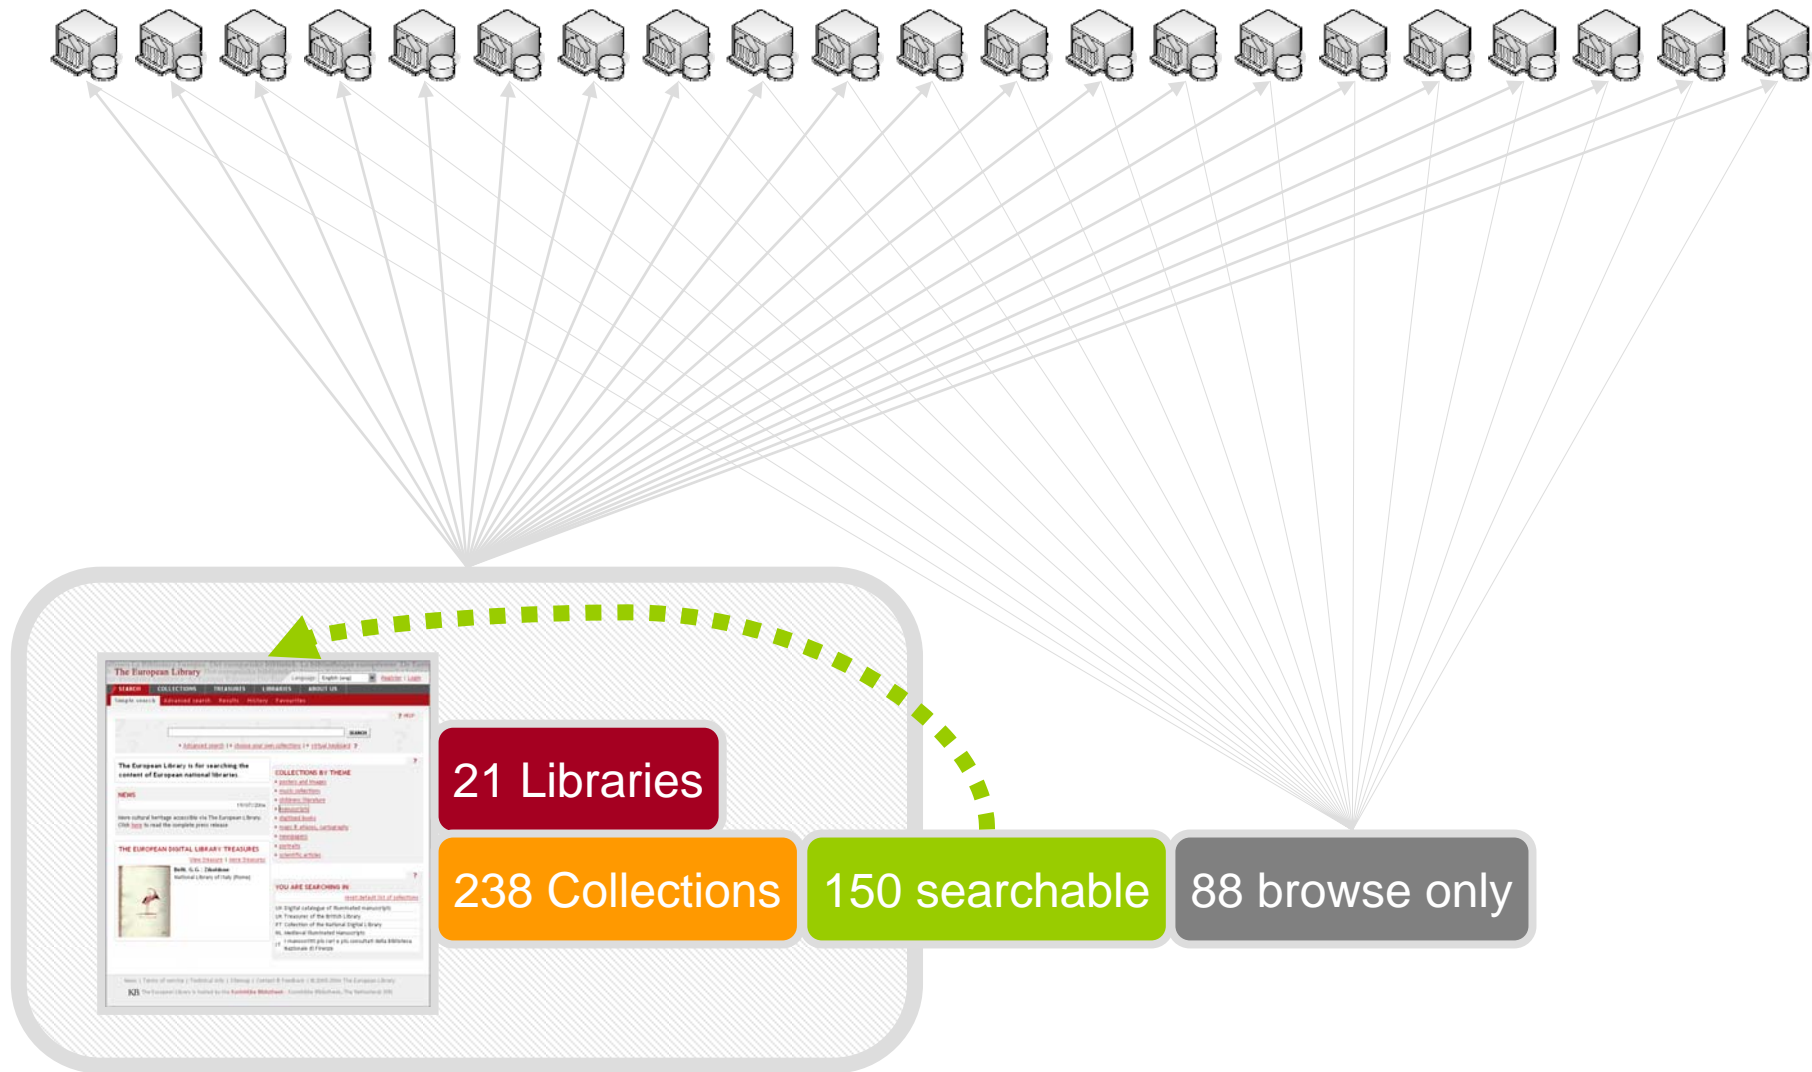

Search/retrieve - local gateway

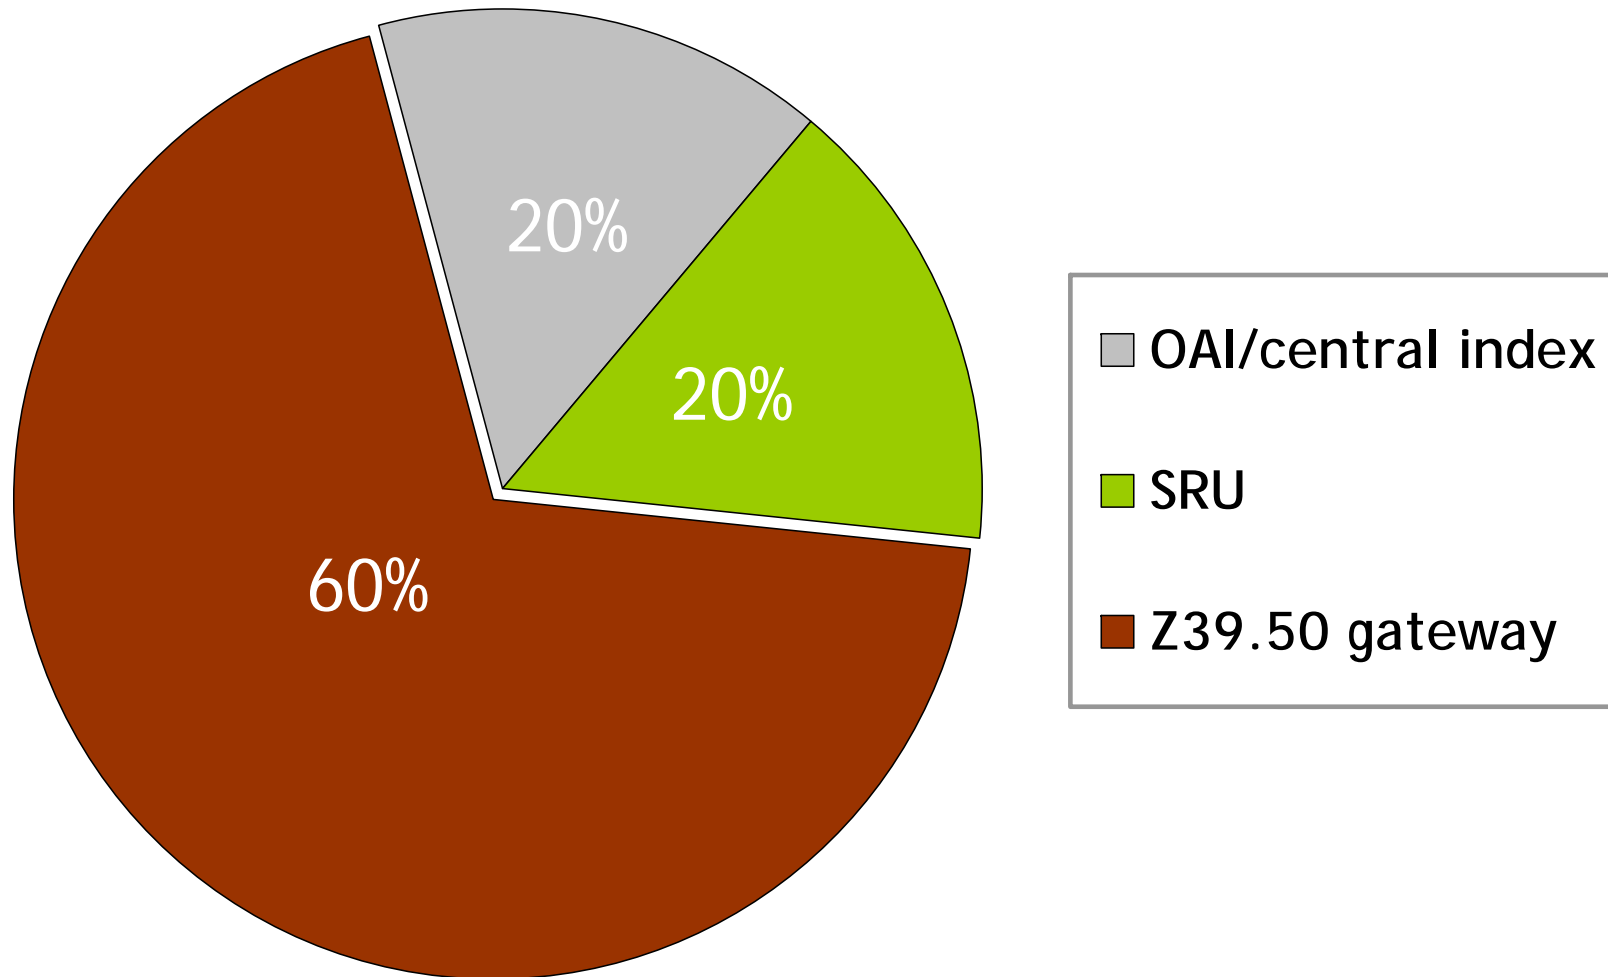

Search/retrieve - all at once!

Distribution of protocols

Different levels of Interoperability

➔ Basic federated interoperability

- TEL application profile for applications is the largest set of common metadata fields that trigger functionality in the portal
- Allows libraries with wide-ranging metadata formats (e.g. *MARC*) to be uniformly queried.
- Works fine for basic disclosure
- Portal interface translations, currently 21 languages are supported

Why is the devil in the details?

- ➔ There is almost no homogeneity in the ca. 250 collections in, for example:
 - Metadata formats
 - Subject headings
 - Normalisation rules
 - Cataloguing schemes
 - Languages (ca 30 languages by the end 2007)
 - Encoding schemes (additionally problems with composed and decomposed unicode characters)
 - Etc.

Different levels of Interoperability

- ➔ Focus fields for more fine-grained interoperability in 2007 in the portal:
 - Target adaptive normalisation
 - better handling of composed vs. decomposed unicode glyphs
 - better handling of target-specific non-unicode character encoding requirements
 - Multi-lingual subject access
 - Mapping of various cataloguing schemes to provide unified access for the user on record level
 - Multi-lingual search in free text fields (from any to all)
- ➔ How?
 - Collection specific or target aware Query construction?

Thank you !
