DELOS Network of Excellence on Digital Libraries

DL Architectures

TEL – DELOS Meeting

Donatella Castelli CNR-ISTI, Italy Heiko Schuldt University of Basel, Switzerland UMIT, Austria

DELOS NETWORK OF EXCELLENCE ON DIGITAL LIBRARIES End-user requirements: some examples

"I would like to be able to search trasparently across the large collections of documents held by European libraries" (scalability)

"I need a good response time for this functionality" (performance)

"The search language does not always satisfy my needs, I would like to replace it with a richer one" (easy update)

DELOS NETWORK OF EXCELLENCE ON DIGITAL LIBRARIES LIBRARIES LIBRARIES

"We have spent a lot of effort for creating this repository; it has always been managed following our own established rules; our staff is used to these procedures. We are willing to share the content, but we do not want to change the way in which is managed" (independence)

"We got a large collection of audiovisual material, our server has not enough storage capabilities. We would like to store this collection elsewhere." (distribution)

"We have just digitised and make it accessible on-line a very important collection. We need a system able to support a much larger number of users than before." (scalability)

NETWORK OF EXCELLENCE ON DIGITAL LIBRARIES

Developer requirements: some examples

- "I must deliver the system a soon as possible, I would like to be able to add the functionality that will serve the needs of the users in 2010 incrementally" (extensibility)
- "I would like to have a mechanisms for 'Lower the barrier for users to remix the output of services'" (composability)

- 1. An appropriate software architecture
- 2. An appropriate middleware

NETWORK OF EXCELLENCE ON DIGITAL LIBRARIES

Monolithic Systems vs. Service-Orientation

- Many current DL systems have evolved over time, leading to a monolithic system architecture
- Problems
 - Search over different DLs/collections?
 - Add new functionality?
 - Scalability: support large number of users/documents?

NETWORK OF EXCELLENCE ON DIGITAL LIBRARIES

Monolithic Systems vs. Service-Orientation

- Provide functionality by means of independent services
 - Search over different DLs/collections
 - Add new functionality
 - Scalability: support large number of users/documents (replication of services or content)

Distribution

Network of Excellence on DIGITAL LIBRARIES

Service Composition

2006-02-02

DL Architectures

Network of Excellence on DIGITAL LIBRARIES

Service Composition

NETWORK OF EXCELLENCE ON DIGITAL LIBRARIES

Service Composition

- Users should not have to deal with service composition
- Basic DL functionality: workflow/process support
- If needed: DL user to define her/his own new services

DL Architectures

NETWORK OF EXCELLENCE ON DIGITAL LIBRARIES

DELOS Contribution

- A Reference Model for Digital Libraries
- Identification of functionality at different levels
 - Realized by means of services
 - Choose services needed for a concrete DL
 - Service composition
- TEL-DELOS coopertion

for the validation/refinement of the Reference Model

NETWORK OF EXCELLENCE ON DIGITAL LIBRARIES

DELOS Contribution

Prototype development

- Integration of DL services provided by DELOS partners
- Integration of TEL services?
